

The Future of Engineering Communication

iQTeams – Benefits

1

One central interface

The systems engineering tool iQUAVIS has merged with the collaboration tool Microsoft Teams. Implement this new product called iQTeams as the central interface in your development process. One advantage of this smart merge: you can access the documentation of all project-related content previously discussed across departments.

2

Storing project related knowledge smartly

Saving and storing post meeting project related information and decisions is rather burdensome. Instead of facing such undertakings manually, iQTeams automatically saves all statements, decisions and comments and puts such into context with the associated system component. As a result, all relevant information is saved promptly, sustainably, in its logical place and long term.

3

Fewer search efforts

Spend significantly less time on conducting elaborate and individual searches as well as on compiling relevant information: iQTeams stores information in a way that is precise and also unambiguously linked to its appropriate elements of the development process. Once you navigate to any particular component of your development process, all its important information will be immediately available and accessible to you.

4

Fewer interpretation errors and faster response times

Questions arising about a component of the development process and its history can be answered comprehensibly and promptly. Because every element of the development process has all its relevant information attached and thus tells its story. One click (on the element) and it is all there - complete and transparent! Thus, subsequent tasks can be identified clearly and tackled right away.

5

The synergy with Microsoft Teams gives you an intuitive interface

Extent your communication horizon and add the “engineering” dimension by making use of the synergy between Microsoft Teams and iQUAVIS. You are already familiar with using the communication tool Microsoft Teams? Great! Its operational method and its integrated Microsoft products will remain the same. It is simply merged with the intuitive interface of the modelling tool iQUAVIS.

6

Conclude your project faster

You will be more efficient thanks to these three capabilities: a) the ability to save important information automatically and sustainably after they were put into context b) the ability to reconcile such information directly with the appropriate component of the development process c) free flowing traceable communication within the established Microsoft tool Microsoft Teams.
